

End-to-end operating flow

A multi-pharmacy, batch-level inventory, sales, procurement, expiry and waste-control workflow

Controlled stock movement

Purchase

Supplier -> pharmacy batch stock

Dispense

Pharmacy -> named hospital department

Sale

Pharmacy -> named buyer with bill

Return / waste

Quarantine -> supplier or authorised collector

Data accountability at every stage

Pharmacy isolation

Each hospital/pharmacy sees only its own medicines, batches, users, purchases, sales and reports.

Batch traceability

Every movement keeps the batch number, supplier, expiry date, storage or department destination.

Financial visibility

Sales & purchases provides separate totals, bill count, purchase-order count and per-pharmacy purchase records.

Audit evidence

Email events, stock movements, return collection and signed handover references are retained as audit logs.

Important: Reference catalogues guide selection only. Each pharmacy must verify local regulatory approval, supplier credentials, prices, batches and stock before use.

Expiry prevention, returns and safe disposal

A controlled chain of custody that prevents unsafe sale, dumping and unauthorised disposal

Communication controls

SMTP test confirms email before operations. Supplier return emails and purchase-order emails use the configured sender. Failed delivery is shown as an error, never recorded as sent.
